Amendment Dated: May 2, 2006

Reply to Office Action Mailed: November 2, 2005

Attorney Docket No.: 056203.53295US

Amendments to the Claims:

The listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Original) A radar apparatus for detecting an object comprising:

transmitting means for transmitting an electromagnetic wave; and

receiving means for receiving an electromagnetic wave reflected

from the object,

wherein:

the radar apparatus has a first operation mode and a second operation mode requiring an energy consumption less than an energy consumption of the first operation mode; and

the first operation mode and the second operation mode are switched in accordance with an output signal from said receiving means.

2. (Currently Amended) The radar apparatus according to claim 1, further comprising:

A/D converting means for A/D converting a signal supplied from said receiving means; and

Amendment Dated: May 2, 2006

Attorney Docket No.: 056203.53295US

digital signal processing means for processing an A/D converted digital signal,

wherein:

the radar apparatus has a function of detecting one or more of a relative velocity rate, a range and an azimuth angle of the object; and

said digital signal processing means has at least two operation modes, the first operation mode and the second operation mode and has a function of switching the operation modes in accordance with a signal supplied from judging means for judging whether a received signal satisfies predetermined conditions.

3. (Original) The radar apparatus according to claim 2, wherein:

in the second operation mode, said judging means has a function of judging whether an amplitude of the received signal exceeds a predetermined threshold level and a function of changing an operation mode of said digital signal processing means from the second operation mode to the first operation mode.

4. (Original) The radar apparatus according to claim 2, wherein:

in the second operation mode, said judging means has filtering means and a function of changing an operation mode of said digital signal

Attorney Docket No.: 056203.53295US

processing means from the second operation mode to the first operation mode,

when an amplitude of the received signal passed through said filtering means

exceeds a predetermined threshold level.

5. (Original) The radar apparatus according to claim 3, wherein said judging

means has a function of counting a number of times when the amplitude of the

received signal exceeds the predetermined threshold level.

6. (Original) The radar apparatus according to claim 2, wherein said judging

means has a function of changing judgment conditions of said judging means and

a function of setting the judgment conditions when said digital signal processing

means is in the first operation mode.

7. (Currently Amended) A radar apparatus for detecting one or more of a

relative velocity rate, a range and an azimuth angle of an object, comprising:

transmitting means for transmitting an electromagnetic wave;

receiving means for receiving an electromagnetic wave reflected

from the object;

A/D converting means for A/D converting a received signal; and

digital signal processing means for processing an A/D converted

digital signal,

wherein:

Attorney Docket No.: 056203.53295US

said digital signal processing means has at least two operation modes, a first operation mode and a second operation mode;

said digital signal processing means has judging means for judging whether the received signal satisfies predetermined conditions; and

said digital signal processing means has a function of changing an operation mode of said digital signal processing means from the first operation mode to the second operation mode in response to a command from said judging means.

- 8. (Original) The radar apparatus according to claim 7, wherein the radar apparatus has a function of changing judgment conditions of said judging means.
- 9. (Currently Amended) A radar apparatus for detecting one or more of a relative velocity rate, a range and an azimuth angle of an object, comprising:

transmitting means for transmitting an electromagnetic wave;

receiving means for receiving an electromagnetic wave reflected from the object;

A/D converting means for A/D converting a received signal; and digital signal processing means for processing an A/D converted digital signal,

Amendment Dated: May 2, 2006

Attorney Docket No.: 056203.53295US

wherein:

said digital signal processing means has at least two operation

modes, a normal operation mode and a low energy consumption mode, and a

function of inputting an operation mode switching signal from an external of the

radar apparatus.

10. (Original) The radar apparatus according to claim 2, further comprising

communication means for communicating with an external and notifying the

external of a state of a normal operation mode and a low energy consumption

mode.

11. (New) The radar apparatus according to claim 2, wherein said second

operation mode is carried out by stopping a part of operation of a microprocessor

and an A/D converter within said radar apparatus.
